<p>The Arthropods are the largest group of animals on earth. All arthropods are covered by a hard exoskeleton, and have segmented bodies. They include spiders, insects, and shellfish.</p>	<p>Insecta is a class of animals under the subphylum Hexapoda. They have a three-part body (head, thorax, and abdomen), three pairs of jointed legs, compound eyes, and two antennae.</p>
<p>Chelicerates is a subphylum of the arthropod phylum. They have 3-segmented bodies with jointed limbs. Types of chelicerates include horseshoe crabs, scorpions, and spiders.</p>	<p>Trilobites (meaning "three lobes"), is an extinct subphylum of Arthropods. They were ocean-dwelling; many trilobite fossils can be found today. There were up to 17,000 different species.</p>
<p>Myriapoda, a subphylum of Arthropods, contains millipedes and centipedes. There are 13,000 species, all of which live on land. The number of legs range from less than ten to over 750.</p>	<p>The subphylum Hexapoda is the largest (in terms of number of species) grouping of arthropods and includes all insects. Most hexapods have three sets of legs (Greek: hex=six, pod=leg).</p>
<p>Crustacea is a subphylum of Arthropoda that contains over 50,000 species including lobsters, crayfish, and shrimp. They have an exoskeleton, which they shed in order to grow.</p>	<p>Arachnida is a class of animals under the subphylum Chelicerata. It includes spiders, scorpions, ticks and mites. All animals in this class have eight legs and have no antennae or wings.</p>
